Crabgrass Prevention

Not only can crabgrass be a real eyesore to your lawn, it can also be a real problem. Fortunately its only annual and dies each winter, giving you a new chance each spring to keep away. The key to crabgrass control is *timing*.

To get great control of crabgrass and weeds, apply Jonathan Green Crabgrass Preventer plus Green Up Fertilizer in early to late April. This will help control crabgrass and weed seeds from growing, but will also green up your lawn after a hard winter.

Unfortunately your lawn isn't out of the woods yet. Crabgrass and weeds like chickweed will make an appearance in late summer and fall, after the crabgrass preventer is used up. To further prevent crabgrass and weeds through to fall, use Jonathan Green Crabgrass and Weed Preventer by July 4th and you will be weed-free through fall without the danger of fertilizer burn.
